

# Introduction

## Objectives and Requirements

The goal of this project was to create a Python program that calculates the Scrabble score of a word. The program includes the following features:

- It calculates the score of a word based on the value of each letter given in the assignment.
- The program considers both upper and lower-case letters to be the same.
- The player has to enter a word with a randomly chosen length.
- Players have 15 seconds to enter the word, and they get extra points for entering it faster.
- The word must be valid and checked using an online dictionary.
- The game runs for 10 rounds or until the player quits, and the total score is shown at the end.

## Unit Testing Tool

I used Python unittest tool to automatically test our code. The unittest is a testing tool that checks if the code works as expected. I used it to write tests first, then wrote the code to pass those tests. This method is called **Test Driven Development (TDD)**.

---

# Process

## How TDD and Unit Testing Were Used

1. **Writing Tests First:** I started by writing tests to check if the program calculates the Scrabble score correctly, validates the words, and handles user input.
2. **Test Scenarios:**
  - Checked if the program correctly calculates the score of words like "Assignment", "quiz", "cabbage", "apple" and "XylophOne"
  - Tested if the program can correctly identify real words and reject fake words.
  - Made sure the program gives feedback when the user enters something wrong, like numbers or a word of the wrong length.
3. **Writing Code After Tests:** Once the tests were ready, I wrote the program to pass all the tests. I kept running the tests to check that the code worked.

## Screenshots

Here's what some useful screenshots would show:

- **Screenshot 1:** The program correctly calculates and displays the score for a word like "apple".

```
Python Console

Round 1
Enter a word with 5 letters. You have 15 seconds.
Enter your word: >? apple
Score for 'apple': 19. Total score: 19
```

- **Screenshot 2:** The program gives feedback when the user enters invalid input, like a word with numbers.

```
Python Console

Round 1
Enter a word with 4 letters. You have 15 seconds.
Enter your word: >? try4
Invalid input! Please enter a word with only alphabetic characters.
Enter your word:
>?
```

- **Screenshot 3:** All unit tests passing, showing "OK" when the tests are run.

```
Run Python tests for index.TestScrabbleGame x

Test Results 2 sec 74 ms
  index 2 sec 74 ms
    TestScrabbleGame 2 sec 74 ms
      test_invalid_word 1 sec 431 ms
      test_scrabble_score 0 ms
      test_valid_word 643 ms

Tests passed: 3 of 3 tests - 2 sec 74 ms

Testing started at 4:42 pm ...
Launching unittests with arguments

Ran 3 tests in 2.076s

OK

Process finished with exit code 0
```

- **Screenshot 4:** The program rejects an invalid word not found in the dictionary.

```
Python Console

Round 1
Enter a word with 6 letters. You have 15 seconds.
Enter your word: >? Rahman
Invalid word. Please enter a valid word from the dictionary.
Enter your word:
>? |
```

---

## Conclusion

### What We Learned

- **What Worked Well:**
  - Writing tests first (TDD) made sure the code worked as planned from the start.
  - The unittest tool helped ensure the program could handle different situations, like invalid input and calculating scores correctly.
  - The program gave clear feedback to the user when they entered something wrong.
- **What Could Be Better:**
  - **Dictionary API Errors:** If there's a problem with the dictionary API (like no internet connection), the program doesn't handle it well. Adding error handling for this would improve the user experience.
  - **Timer System:** The current timer works, but it could be improved to stop exactly when the player finishes typing.

### Improvements

- **Faster Testing with API Mocking:** Right now, the tests rely on live dictionary API calls. This can slow things down. We could use a method called "mocking" to simulate API responses and make tests faster.
- **User Experience:** Adding a graphical interface (like buttons and text boxes) could make the game more fun and easier to play.
